

KONGSBERG

Thruster Digital Twin

Introduction & Motivation

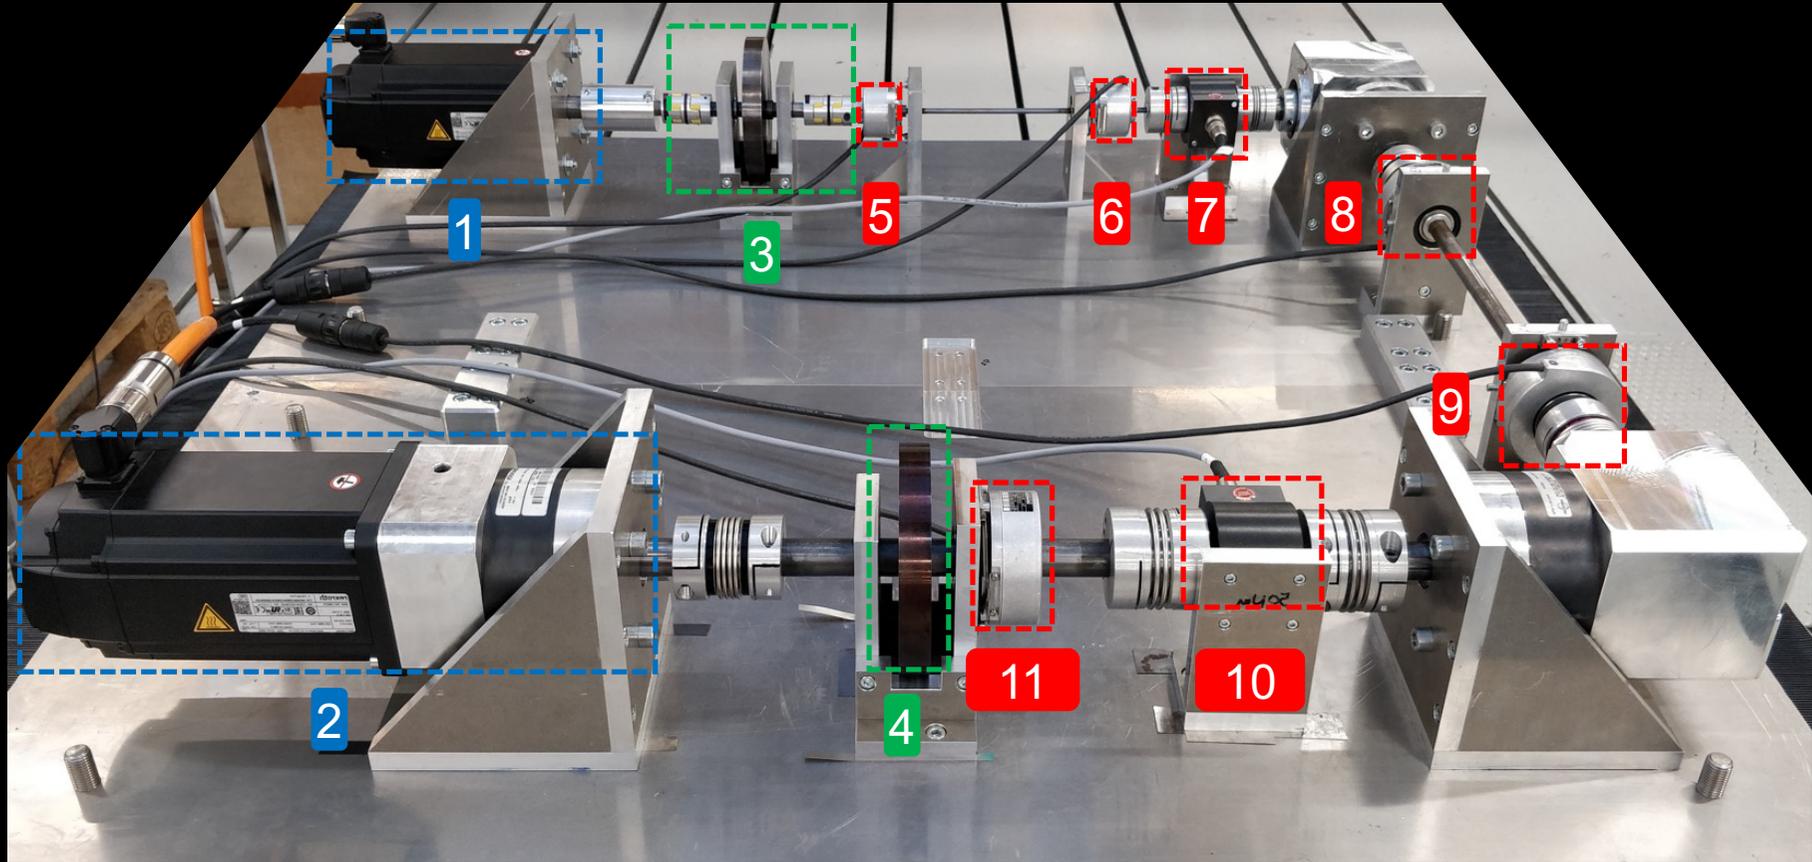

Test bench

Propeller and Gear Propeller shaft

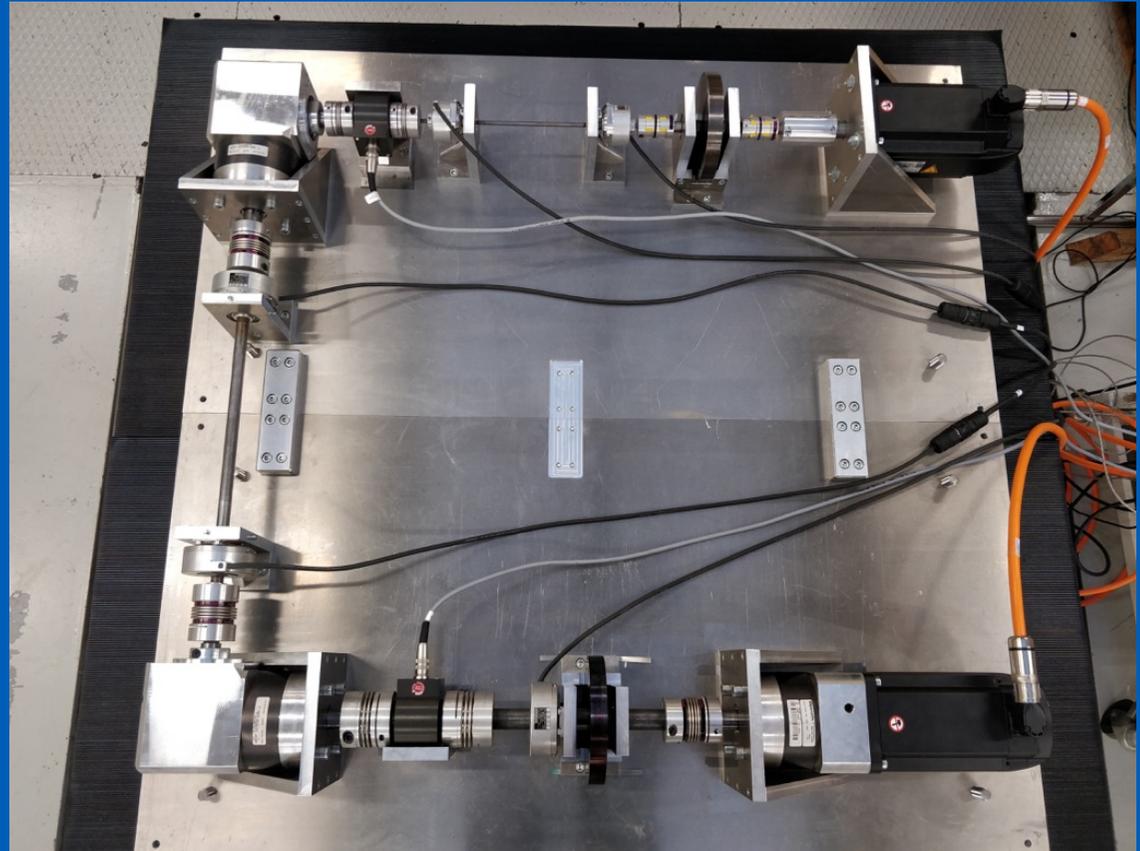

Test bench components

- | | | | | |
|------------------|---------------------|---------------------|----------------------|------------|
| 1 Driving motor | 3 Flexible coupling | 5 Encoder | 8 Encoder | 11 Encoder |
| 2 Load generator | 4 Propeller mass | 6 Encoder | 9 Encoder | |
| | | 7 Torque transducer | 10 Torque transducer | |

Virtual sensor for thruster

—
Jesse Miettinen
Doctoral Candidate

(Sampo Haikonen & Ivar koene)

Virtual sensor

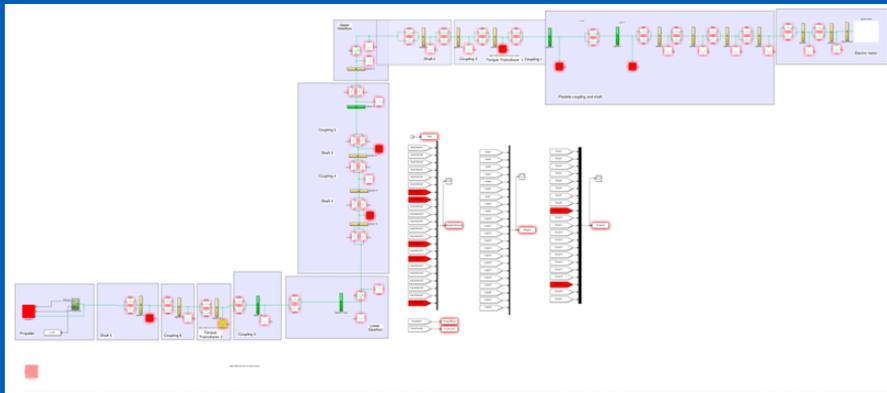

- Definition:
 - Computational model that estimates physical quantities indirectly
- Useful:
 - If using physical sensor is difficult;
 - Geometrical restrictions or hazardous environment
 - As secondary information source;
 - When sensor is broken (for example)

Data driven virtual sensor

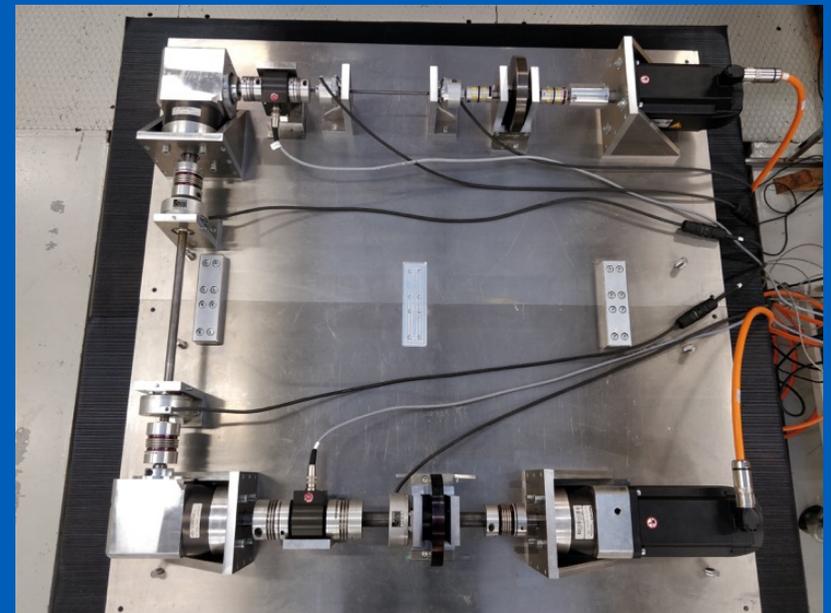

- Definition:
 - Machine learning model that estimates physical quantities indirectly
- Requires:
 - Training data and test data

Data driven virtual sensor

- Training data:
 - Simulated thruster
- Test data:
 - Down scaled thruster

(Kongsberg & Åbo Akademi)

(Sampo Haikonen & Ivar koene)

Data driven virtual sensor

- Preliminary results:
